Message from the California Department of Developmental Services

Mission: The Department of Developmental Services (DDS) is committed to providing leadership that results in quality services to the people of California and assures the opportunity for individuals with developmental disabilities to exercise their right to make choices.

The NCI Adult In-Person Survey¹ report was compiled by the Human Services Research Institute (HSRI) in accordance with Welfare and Institutions Code (WIC), Section 4571. It is an important effort to collect accurate, reliable, and valid consumer and family satisfaction measures, as well as consumer outcome data. More information about the California NCI can be found at <http://www.dds.ca.gov/QA/>.

This is the fourth administration of the Adult In-Person Survey, with data collected from July 2017 through June 2018. During that time, 8,280 face-to-face surveys were completed with adults with intellectual/developmental disabilities receiving at least one service beyond case management from a regional center. These findings contribute to our understanding of how California's system is performing. California can use these reports to monitor changes in the system and to guide strategic planning and quality improvement activities. Regional centers can use the data in a similar fashion at the local level.

This report does not compare California's data to the data of other states, but does include the NCI Average across participating NCI states. This is because California's DDS service system is unique among states. Some of the things that make California's service system unique include:

1. California has longstanding statute that ensures services and supports are provided for eligible persons with intellectual/developmental disabilities.
2. California's laws mandate intake, evaluation and assessment within 120 days.
3. California has a broad eligibility definition for receiving services.
4. California has mandated services, including case management, with statutory limitations on caseload size.
5. California's service obligations to the families needing services are, by law, from pre-conception to death.
6. California's regional centers are, by design, autonomous in that each center has a local board of directors to best address the unique needs of each of the 21 regions.
7. Consumers or their families can call a team meeting at any time to request a change in service.

Reports like this offer DDS the opportunity to compare the results of the data across the years. System improvements will take time to identify and achieve, but this report provides valuable data and is one more tool in our continuous effort to improve services and supports to individuals with intellectual/developmental disabilities across California.

¹ Formerly the Adult Consumer Survey

Acknowledgements

This report would not be possible if not for the 8,280 individuals who agreed to offer their time and discuss their lives in order to assist in improving the services of all people with intellectual/developmental disabilities in California. Additionally, a special mention goes to the families, friends, and staff members who participated in the survey process.

List of Abbreviations Used in This Report

AFS - Adult Family Survey

ARCA - Association of Regional Center Agencies

CAC - Consumer Advisory Committee

CA-ODESA - California Online Data Entry Survey Administration

CCF - Community Care Facility

CIP - Core Indicators Project

CFS - Child Family Survey

CMS - Centers for Medicare & Medicaid Services

DDS - Department of Developmental Services

FGS - Family/Guardian Survey

FHA - Family Home Agency

HCBS – Home and Community-Based Services

HSRI - Human Services Research Institute

ICF - Intermediate Care Facility

ILS/SLS - Independent Living Services/Supported Living Services

NASDDDS - National Association of State Directors of Developmental Disabilities Services

NCI - National Core Indicators

QAC - Quality Assessment Coordinator

RC - Regional Center

SCDD - State Council on Developmental Disabilities

List of Regional Center Abbreviations

ACRC- Alta California Regional Center

CVRC- Central Valley Regional Center

ELARC- Eastern Los Angeles Regional Center

FNRC- Far Northern Regional Center

FDLRC- Frank D. Lanterman Regional Center

GGRC- Golden Gate Regional Center

HRC- Harbor Regional Center

IRC- Inland Regional Center

KRC- Kern Regional Center

NBRC- North Bay Regional Center

NLACRC- North Los Angeles County Regional Center

RCEB- Regional Center of the East Bay

RCOC- Regional Center of Orange County

RCRC- Redwood Coast Regional Center

SARC- San Andreas Regional Center

SDRC- San Diego Regional Center

SGPRC- San Gabriel/Pomona Regional Center

SCLARC- South Central Los Angeles Regional Center

TCRC- Tri-Counties Regional Center Regional Center

VMRC- Valley Mountain Regional Center

WRC- Westside Regional Center

CA Adult In-Person Survey Highlights FY17/18

The National Core Indicators (NCI) are standard measures used across states to assess the outcomes of services provided to individuals with intellectual/developmental disabilities and their families. Indicators address key areas of concern such as employment, respect/rights, service planning, community inclusion, choice, and health and safety. The data that result from NCI surveys are often used to inform strategic planning, produce legislative reports, and prioritize quality improvement initiatives. Many states also share the data with stakeholder groups such as Quality Councils and use the stakeholder feedback to help set priorities and establish policy direction.

The NCI In-Person Survey² is administered to individuals with intellectual/developmental disabilities who receive at least one service other than case management. Not all states that participate in NCI administer the In-Person Survey on an annual basis. Of the 46 states, District of Columbia and 22 sub-state entities who participated in NCI during the 2017-18 data collection cycle, 35 states and the District of Columbia submitted a valid sample of In-Person Survey data.³ This Final Report provides a summary of results based on data submitted by June 30, 2018.

In California, the In-Person Survey is administered once every three years and data are collected from all 21 regional centers. The California statewide average is comprised of this data. **Please note: the NCI and CA averages shown throughout this report are weighted.**⁴

The following are California statewide averages for a selection of survey items. Complete breakouts by regional center, California statewide, and NCI national averages for each item in the In-Person Survey can be found in the Results section of this report.

² Formerly, the Adult Consumer Survey

³ The following states are represented in the NCI Average in this report: Alabama (AL), Arizona (AZ), Arkansas (AR), California (CA), Colorado (CO), Connecticut (CT), Delaware (DE), District of Columbia (DC), Florida (FL), Georgia (GA), Illinois (IL), Indiana (IN), Kansas (KS), Kentucky (KY), Louisiana (LA), Maine (ME), Massachusetts (MA), Michigan (MI), Minnesota (MN), Missouri (MO), North Carolina (NC), Nebraska (NE), Nevada (NV), New York (NY), Ohio (OH), Oklahoma (OK), Oregon (OR), Pennsylvania (PA), Rhode Island (RI), South Carolina (SC), Tennessee (TN), Utah (UT), Vermont (VT), Virginia (VA), Wisconsin (WI), and Wyoming (WY).

⁴ For more information see “Weighting” in the Methodology section.

2017-18 In-Person Survey

CA Average Data (Weighted)

8,280 adults with I/DD participated in 2017-18 across California Regional Centers.

Respondents are adults with I/DD age 18 and older receiving at least one paid service (in addition to case management) from a regional center.

Residence

| | |
|------------------------------|-----|
| Parent or relative's home | 45% |
| CCF | 27% |
| Own home/apartment (ILS/SLS) | 17% |
| ICF or SNF | 9% |
| FHA | 1% |
| Other/don't know | 1% |

Level of Intellectual Disability

| | |
|------------------------|-----|
| Mild ID | 47% |
| Moderate ID | 45% |
| Severe ID | 14% |
| Profound ID | 9% |
| Unspecified or unknown | 5% |

- **59%** are male
- **85%** have ID**
- **41** is the average age

CA Qualifying Conditions** Not mutually exclusive

Have a primary care doctor

Visited dentist in the past year

Reported to be under conservatorship

**Don't know' responses included in denominator

2017-18 In-Person Survey

Like their home

Like their paid job in the community

Feel services are helping them live a good life

- **78%** have friends who are not staff or family
- **80%** can see friends when they want

- **42%** want more help to make or keep in contact with friends
- **10%** often feel lonely

Privacy and Respect

Access and Inclusion

- **93%** have the **transportation** they need to get where they **need** to go
- **85%** are able to go out and **do the things they like to do**
- 84%** have the **transportation** they need to get where they **want** to go
- 79%** get to **do things they like to do as often as they want**
- 85%** have **enough** things they **enjoy doing when at home**

Would like paid job in the community

Take classes/trainings to get job/better job

Have paid community employment as goal in service plan

II. Results

This section briefly describes the structure of the survey instrument and presents the results of the most recent data collection cycle.

Survey Administration

Thirty-five (35) states and the District of Columbia administered the In-Person Survey (IPS) in 2017-18 and submitted valid samples for analysis: Alabama (AL), Arizona (AZ), Arkansas (AR), California (CA), Colorado (CO), Connecticut (CT), Delaware (DE), District of Columbia (DC), Florida (FL), Georgia (GA), Illinois (IL), Indiana (IN), Kansas (KS), Kentucky (KY), Louisiana (LA), Maine (ME), Massachusetts (MA), Michigan (MI), Minnesota (MN), Missouri (MO), North Carolina (NC), Nebraska (NE), Nevada (NV), New York (NY), Ohio (OH), Oklahoma (OK), Oregon (OR), Pennsylvania (PA), Rhode Island (RI), South Carolina (SC), Tennessee (TN), Utah (UT), Vermont (VT), Virginia (VA), Wisconsin (WI), and Wyoming (WY).

Together, they collected survey responses and information from a total of 25,671 individuals. Data from California were collected across regional centers, a total of 8,280 valid surveys were collected.

Survey Development

The IPS was initially developed by a technical advisory subcommittee for the purpose of collecting information directly from individuals with intellectual/developmental disabilities and their families or advocates. Many questions were drawn from survey instruments in use in the field; others were developed specifically for NCI. NCI staff routinely test and refine the instrument based on feedback from surveyors.

Most participating states use the basic survey tool developed by the project. However, some states opt to incorporate additional survey questions to look more deeply at specific issues. The addition of supplementary questions is typically done after a state participates in NCI for at least a year and establishes baseline results. The results from those supplementary questions are not included in this report.

Organization of the Survey

The In-Person Survey consists of a pre-survey form, three distinct survey sections, and a surveyor feedback form. Each is described below.

Pre-Survey Information

This form has questions that help the surveyor prepare for the meeting as well as assist the surveyor in administering the survey questions. Pre-Survey information is not included in the analysis by HSRI and thus not included in this report; it is for surveyor use only.

Background Information

This section consists of questions about demographics, residence, health, employment status, and services and supports. Data is generally collected from state records, case managers/service coordinators, or a combination of both.

Section I

This section attempts to determine individuals' level of satisfaction and opinions. It may *only* be completed through a direct meeting with the individual.

Section II

This section contains questions that are answered by a direct meeting with the individual when possible. If the person is unable to respond, a proxy who knows the person well may be used. Case managers/service coordinators are not allowed to respond to these questions on the individual's behalf.

Surveyor Feedback Sheet

This form is used to record information such as the length of the NCI meeting with the individual and any problematic questions encountered.

Presentation of Demographics

The following section details the demographic profile of individuals included in the 2017-18 In-Person Survey. Tables display demographic results listed alphabetically by regional center, followed by the CA Average and NCI Average.

Regional Centers receive an ‘n/a’ designation within the table if fewer than 20 people responded to the survey item; however, their data are included in the CA Average.

Note on CA and NCI Averages: The NCI averages contained in this report are “weighted” means; their calculations reflect the relative population sizes of participating states as well as the states’ sample sizes. Prior to 2016-17, NCI averages were calculated as the simple arithmetic mean of all state means (an approach known as “average of averages”), so comparisons to past reports should be made with caution.

Demographic Characteristics of Respondents

This section presents descriptive information on the respondents surveyed.

For several states included in the NCI Average, survey items in the Background Information section (including certain items related to Demographics, Health, Medication, and Wellness) had a large amount of missing data or data recorded as “don’t know.” Detailed information by state can be found in the NCI National In-Person Survey Report:

<https://www.nationalcoreindicators.org/resources/reports/>

The quantity of missing data can be a result of several factors. We do not know whether the data are missing systematically or randomly; for example, are data missing across the board for those in a specific waiver population in a given state? If so, the resulting data are not representative of the entire sample or population. We advise caution when examining data that are indicated as having high rates of “missing” or “don’t know” responses. Please note that the NCI average reflects the average of data that were reported to NCI and may not be reflective of the service population across the country.

Table 1. Age

| Regional Center | Mean | Min | Max | Standard Deviation | Median | N |

∞Categories are not mutually exclusive and N may differ by category; therefore, N is not shown

±Don't Know responses are included in the denominator

✓CA collected other diagnoses and other health conditions data in the field

*Includes data from states that had at least 25% "don't knows" and missing data

Table 21. Preferred Means of Communication

| Regional Center | Spoken | Gestures | Sign Language | Communication Device | Other | Don't Know | N |

*Includes data from states that had at least 25% "don't knows" and missing data

Core Indicator Outcomes and Comparisons

Across Regional Centers

The following section provides outcome data for the In-Person Survey. Outcome results are presented in subsections that correspond with each of the In-Person Survey domains. Outcome results are first shown in a graph with the CA Average and then in a table that shows a breakout of each regional center’s percentage, the CA Average and NCI Average.

Regional Centers with fewer than 20 respondents to a question ***are not*** included in tables; however, their data ***are*** included in the CA Average.

The CA and NCI Averages are weighted.

Weights for the NCI Average take into account the relative numbers of people receiving services through participating states’ systems. Calculations reflect the relative population sizes of participating states, as well as the sample sizes.

Weights for the CA Average were created because the state intentionally sampled by regional center. The procedure for calculating weights is similar to that for the NCI Average, but uses the number of completed surveys and service population sizes in each stratum (i.e., regional center) separately.

See more about weighting in the Data Analysis section.

Choice and Decision-Making

People make choices about their lives and are actively engaged in planning their services and supports.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

Table 30. Chose or had some input in choosing where they live *if not living in the family home* ('person made the choice' and 'person had some input' responses)

| Regional Center | Yes | No | N |

Work

People have support to find and maintain community integrated employment.

NCI reports on four types of community jobs:

1. Individual job without publicly funded supports—an individual job in which the person does not receive Regional Center or other funded supports;
2. Individual job with publicly funded supports—an individual job in which the person receives Regional Center or other funded supports;
3. Group-supported—a job that takes part in an integrated setting but is done with a group of individuals with disabilities (e.g., work crew). Group-supported jobs may or may not receive publicly funded supports; and
4. **New in 2017-18: Community job in a business that primarily hires people with disabilities**—a job where the employees with disabilities interact with the non-disabled population; this job is ***not*** in a traditional sheltered workshop and is NOT an enclave.

For several states included in the NCI Average, survey items pertaining to paid community employment had a large amount of missing data or data recorded as “don’t know.” Detailed information by state can be found in the NCI National In-Person Survey Report: <https://www.nationalcoreindicators.org/resources/reports/>

The quantity of missing data can be a result of several factors. We do not know whether the data are missing systematically or randomly; for example, are the data missing across the board for those in a specific waiver population in a given Regional Center? If so, the resulting data are not representative of the entire sample or population. We advise caution when examining data that are indicated as having high rates of “missing” or “don’t know” responses. Please note that the NCI average reflects the average of data that were reported to HSRI and may not be reflective of the service population across the country.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

¹¹ California specific question

Community Inclusion, Participation and Leisure

People have support to participate in everyday community activities.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

Relationships

People have friends and relationships.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

Service Coordination

Service coordinators are accessible, responsive, and support the person's participation in service planning.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

Health

People secure needed health services.

Important Note on Missing Data:

For several states included in the NCI Average, survey items in the Background Information section (including certain items related to Demographics, Health, Medication, and Wellness) had a large amount of missing data or data recorded as “don’t know.” Detailed information by state can be found in the NCI National In-Person Survey Report: <https://www.nationalcoreindicators.org/resources/reports/>

The quantity of missing data can be a result of several factors. We do not know whether the data are missing systematically or randomly; for example, are data missing across the board for those in a specific waiver population in a given state? If so, the resulting data are not representative of the entire sample or population. We advise caution when examining data that are indicated as having high rates of “missing” or “don’t know” responses. Please note that the NCI average reflects the average of data that were reported to NCI and may not be reflective of the service population across the country.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

Table 94. Has a primary care doctor or practitioner ('yes' responses only; information may have been obtained through regional center records)

¹³ California specific question

Medications

Medications are managed effectively and appropriately.

Important Note on Missing Data:

For several states included in the NCI Average, survey items in the Background Information section (including certain items related to Demographics, Health, Medication, and Wellness) had a large amount of missing data or data recorded as “don’t know.” Detailed information by state can be found in the NCI National In-Person Survey Report: <https://www.nationalcoreindicators.org/resources/reports/>

The quantity of missing data can be a result of several factors. We do not know whether the data are missing systematically or randomly; for example, are data missing across the board for those in a specific waiver population in a given state? If so, the resulting data are not representative of the entire sample or population. We advise caution when examining data that are indicated as having high rates of “missing” or “don’t know” responses. Please note that the NCI average reflects the average of data that were reported to NCI and may not be reflective of the service population across the country.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

Table 105. Takes at least one medication for mood, anxiety, psychotic disorder and/or behavioral challenges (information may have been obtained through regional center records) ~

Wellness

People are supported to maintain healthy habits.

Important Note on Missing Data:

For several states included in the NCI Average, survey items in the Background Information section (including certain items related to Demographics, Health, Medication, and Wellness) had a large amount of missing data or data recorded as “don’t know.” Detailed information by state can be found in the NCI National In-Person Survey Report: <https://www.nationalcoreindicators.org/resources/reports/>

The quantity of missing data can be a result of several factors. We do not know whether the data are missing systematically or randomly; for example, are data missing across the board for those in a specific waiver population in a given state? If so, the resulting data are not representative of the entire sample or population. We advise caution when examining data that are indicated as having high rates of “missing” or “don’t know” responses. Please note that the NCI average reflects the average of data that were reported to NCI and may not be reflective of the service population across the country.

All CA and NCI Averages are weighted. For more information on weighting see the Data Analysis section of this report.

III.NCI History and Activities

Overview of National Core Indicators

In December 1996, the National Association of State Directors of Developmental Disabilities Services (NASDDDS), in collaboration with the Human Services Research Institute (HSRI), launched the Core Indicators Project (CIP). The aim of the project was to support state developmental disabilities operating agencies in the development and implementation of performance and outcome indicators—and related data collection strategies—so that they could measure service delivery system performance. This effort, now called National Core Indicators (NCI), strives to provide states with valid and reliable tools to help improve system performance and better serve people with intellectual and developmental disabilities and their families. Moreover, NASDDDS' active sponsorship of NCI facilitates pooled knowledge, expertise, and resources among the states.

In 1997, 15 states convened to discuss the scope and content of a potential performance measurement framework. Directors and staff from these 15 states worked to identify the major domains and sub-domains of performance, indicators, measures, and data sources. The original 61 indicators, developed through a consensus process, were intended to provide a system-level “snapshot” of how well each state was performing. The states were guided by a set of criteria that was designed to select indicators that were:

1. Measurable
2. Related to issues the states had some ability to influence
3. Important to all individuals they served, regardless of level of intellectual/developmental disability or residential setting.

During this initial phase, data collection protocols were developed and field-tested, including a face-to-face In-person Survey¹⁴ (for individuals age 18 and older who were receiving services) and a mail-out Adult Family Survey (for families who have an adult family member living at home). Seven states volunteered to pilot test the indicators. Eight additional states served on the Steering Committee.

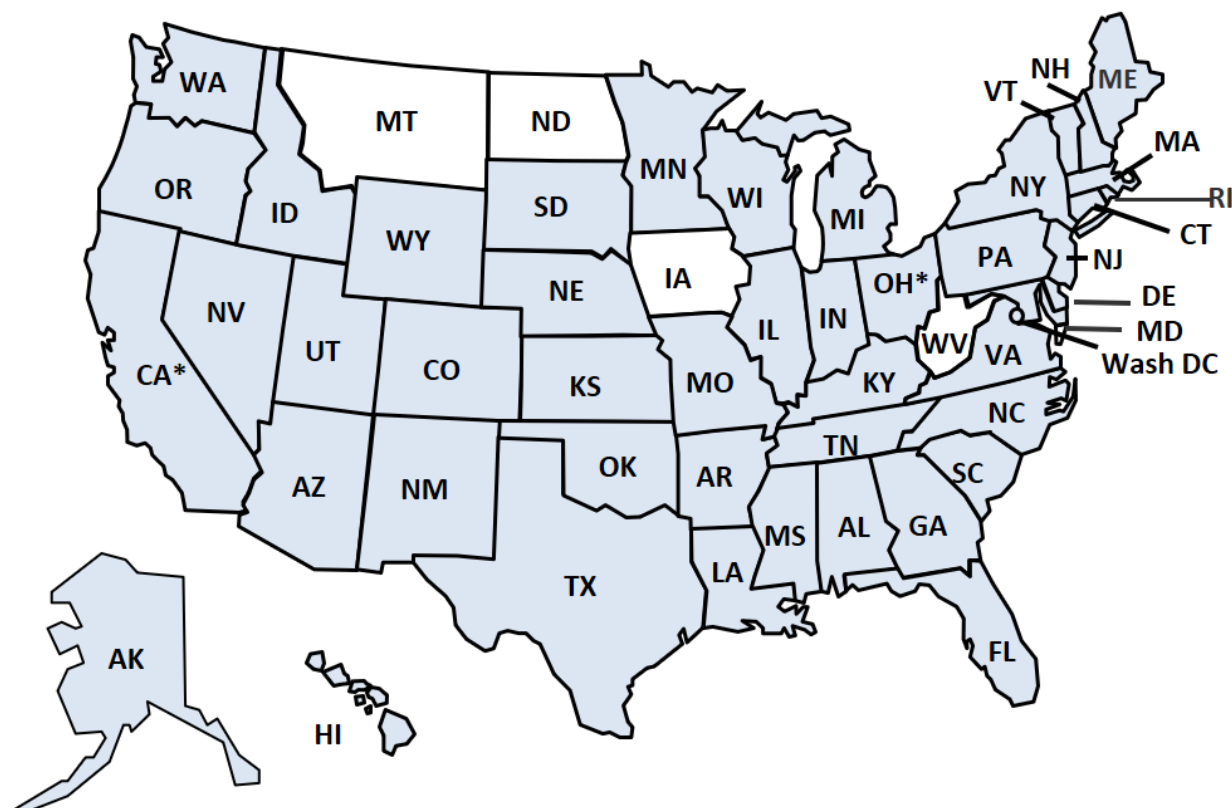

Since the initial field test, NCI has expanded its scope to include outcomes of services for children with intellectual and developmental disabilities and their families. In addition, NCI continues to develop and refine the indicators and expand state participation. For more information about NCI states, technical reports, and other resources, please visit <http://www.nationalcoreindicators.org>.

¹⁴ Formerly named ‘Adult Consumer Survey’

State Participation

During the 2017-18 data collection cycle, 46 states, the District of Columbia and 22 sub-state entities participated in NCI. State participation is entirely voluntary, and the participating states are shown in the chart below. NCI states do not participate in all surveys each year.

Figure A. NCI State Participation 2017-18

The Core Indicators

The Core Indicators are the standard measures used across states to assess the outcomes of services provided to individuals and families. Indicators address key areas of concern, including employment, respect/rights, service planning, community inclusion, choice, and health and safety. An example of a Core Indicator would be, “The proportion of people who have a paid job in the community.” To see the entire list of Core Indicators, please visit <http://www.nationalcoreindicators.org/indicators>.

Each survey instrument is designed to measure certain Core Indicators. While most indicators correspond to a single survey question, a few refer to clusters of related questions. For example, the indicator that measures Community Inclusion (the proportion of people who regularly participate in everyday integrated activities in their communities) is measured by several survey questions that ask about several separate community activities.

The current set of performance indicators includes approximately 100 consumer, family, system, and health and safety outcomes—outcomes that are important to understanding the overall health of public developmental disabilities agencies. Indicators are organized across five broad domains: Individual Outcomes; Health, Welfare and Rights; Staff Stability and Competency; Family Outcomes; and System Performance. Each domain is broken down into sub-domains (see Figure B on the following page). Three data sources are used to assess outcomes: the In-Person Survey, three Family Surveys, and a Staff Stability Survey (e.g., staff turnover).

The indicators have remained generally consistent over the last several years and thus can be used to analyze system-level trends over time. However, the NCI program is a dynamic effort that allows for measures to be added, dropped, or changed to reflect current and future priorities of participating states.

The data collection tools used to gather indicator data are regularly refined and tested to ensure they remain valid, reliable, and applicable to current issues within the field. Details on the design and testing of this tool are provided in the next section of this report.

Domains and Sub-Domains

The following table lists the domains and sub-domains covered by the NCI In-Person Survey indicators.

Figure B. In-Person Survey Indicators: Domains and Sub-Domains

| Domain | Sub-Domain | Concern Statement |
|------------------------------------|--|--|
| Individual Outcomes | Work | People have support to find and maintain community integrated employment. |
| | Community Inclusion, Participation and Leisure | People have support to participate in everyday community activities. |
| | Choice and Decision-Making | People make choices about their lives and are actively engaged in planning their services and supports. |
| | Self Determination | People have authority and are supported to direct and manage their own services. |
| | Relationships | People have friends and relationships. |
| | Satisfaction | People are satisfied with the services and supports they receive. |
| Health, Welfare, and Rights | Safety | People are safe from abuse, neglect, and injury. |
| | Health | People secure needed health services. |
| | Medications | Medications are managed effectively and appropriately. |
| | Wellness | People are supported to maintain healthy habits. |
| | Respect/Rights | People receive the same respect and protections as others in the community. |
| System Performance | Service Coordination | Service coordinators are accessible, responsive, and support the person's participation in service planning. |
| | Access | Publicly funded services are readily available to individuals who need and qualify for them. |

How NCI Data Are Used

The Core Indicators provide information for quality management and are intended to be used in conjunction with other state data sources, such as risk management information, regional level performance data, results of provider monitoring processes, and administrative information gathered at the individual service coordination level. States typically use the indicator data to inform strategic planning, produce legislative reports, and prioritize quality improvement initiatives. Some states use NCI as a data source for supplemental performance measures in their home and community-based services (HCBS) waiver quality management systems and include the information

in support of evidentiary reports to the Centers for Medicare & Medicaid Services (CMS). Many states share the indicator data with stakeholder groups such as Quality Councils and use the stakeholder feedback to help set priorities and establish policy direction. It is also important to note that states do not use the information in a punitive way to sanction service providers, nor do they use the results to remediate individual issues (unless specifically requested by the participant or required by law as in the case of suspected abuse, neglect, or mistreatment).

For more information on how to use these data for quality improvement, please see this handbook: [Using National Core Indicators for Quality Improvement Initiatives](#).¹⁵

Caution and Limitations

This report does not provide benchmarks for acceptable or unacceptable levels of performance. Rather, it is up to each state to decide whether its score or percentage is an acceptable performance level. It is up to public managers, policy-makers, and other stakeholders to decide whether results suggest that changes or further investigation are necessary.

Moreover, the NCI Average should be interpreted as a multi-state “norm” that describes average levels of performance or satisfaction across the participating states. In some instances there are few significant differences among the states; this denotes that the majority of states are performing similarly. Instances in which several states’ results are especially high (considerably above the average level) indicate the levels of performance or satisfaction achieved in those states might define a level of performance that may serve as a guidepost for other states. All state outcomes can be found in the NCI National In-Person Survey Report:

<https://www.nationalcoreindicators.org/resources/reports/>.

Also critical to note is that differences by state in requirements for eligibility for DD services may also be reflected in differences in the NCI data.

¹⁵ Located on the National Core Indicators website: www.nationalcoreindicators.org → Resources → Technical Reports

IV. Methodology

Administration

A key principle of NCI is the importance of gathering information directly from service recipients. The indicators are meant to apply to all individuals receiving services, regardless of intellectual/developmental disability type, and NCI administration protocols dictate that every person selected into the sample is given an opportunity to respond and no one is prescreened or predetermined to be unable to respond. Moreover, survey questions should not be marked “not applicable” on the basis of a person’s level of ability.

Information for the In-Person Survey is collected via a direct conversation with the person receiving services. Additionally, background information is primarily collected from the individual’s record. Section I questions, which pertain to personal experiences and require subjective responses, may only be answered by the individual receiving services. Section II of the survey—which consists of objective questions on the individual’s involvement in the community, their choices, respect and rights, and their access to services—allows for the use of “proxy” or other respondents who know the individual well (such as a family member or friend).

Proxy Respondents

Studies have found that the greatest discrepancies between individual and proxy responses occur when the information being collected is subjective (i.e., related to how a person feels; proxies would be aware of the correct answers only if the individual had previously expressed his or her feelings).¹⁶ Questions relating to observable behaviors tend to have higher levels of agreement between the proxy and the individual. By excluding proxies, a large percentage of individuals (most of whom are unable to respond) would be unrepresented in the data. Thus, the NCI project determined at the outset that proxy respondents would be used, though only for specific questions and only in situations where the individual surveyed either could not effectively communicate with the surveyor or chose to have a proxy respondent.

As mentioned, the use of proxy respondents for the NCI tool is limited to questions in Section II, which relates to observable and/or measurable items: Community Inclusion,

¹⁶ Magaziner, Jay, Sheryl Zimmerman, Ann L. Gruber-Baldini, J. Richard Hebel, and Kathleen M. Fox. "Proxy Reporting in Five Areas of Functional Status Comparison with Self-Reports and Observations of Performance." *American Journal of Epidemiology* 146.5 (1997): 418-28.

Choices, Respect/Rights, and Access to Needed Services. These questions deal with everyday occurrences on which others may reliably report. State records are also used to report objective data on an individual's health status and exam history as well as employment status; this information is collected in the Background Section of the survey.

NCI has taken steps to ensure that the responses gathered are as accurate as possible. First, it is important to make the questions as accessible as possible to increase participation by all individuals. NCI attempts to make the language in the In-person Survey as easy to understand as possible and includes suggested rephrasing for questions that may be nuanced or more difficult to understand. The NCI surveys are also routinely revised based on feedback from states, self-advocates, families, and surveyors who are administering the tool. Secondly, it is important to establish a set of standards for proxy respondents. NCI aims to increase the reliability of proxy responses by allowing only those people who know the individual well (family, friends, staff, etc.) to serve as proxy respondents. To avoid conflict, service coordinators are not allowed to respond as proxies. Further, if both the individual and a proxy respondent answer a question, the individual's answer is recorded so long as his/her answer is deemed reliable by the surveyor. Surveyors also keep track of who responds to each question—the individual or the proxy—and the proxy's relationship to the individual.

Surveyor Training

States employ a variety of individuals to conduct the face-to-face meetings for the NCI In-person Survey. To avoid conflict, surveys cannot be administered by the individual's service provider, relative, personal case manager, staff member, or other close contact. Given this constraint, states often use university students, state staff, private contractors, advocacy organizations, and individuals with disabilities and their families to conduct the surveys.

HSRI and NASDDDS staff provide two sets of trainings each year: a more comprehensive training for new states and states with mostly or all new surveyors and a web-based refresher training for surveyors who have recently participated in the In-Person Survey. Typically, instruction takes the form of a "train-the-trainer" session, whereby staff from the state's lead agency and/or those managing the surveyors provide training to new hires throughout the year. The goal of trainings is to provide a standardized training to ensure uniform application of the survey.

For the FY 17/18 data collection cycle DDS, SCDD, and HSRI provided onsite training in seven centralized regional centers across California. Quality Assurance Coordinators (QACs) and interviewers from all across California took part in a one-day training. Trainings consist of a detailed review of the survey tool and an overview of general surveying techniques. Trainers are given a packet of standardized materials to be used at the on-site training sessions. An additional session reviews the process for entering survey data in the California Online Data Entry Survey Application (CA-ODESA).

Criteria for Exclusion of Responses

All individuals selected in the survey sample are given an opportunity to participate in a face-to-face meeting. There are no prescreening procedures. Exclusion of responses occurs at the time of data analysis by HSRI, based on the criteria described below. There is no threshold of number of answers to be given in order to consider a survey complete.

Surveys are excluded from analysis of questions occurring in Section I if:

- 1) The surveyor indicated that the individual receiving supports did not respond validly to questions in Section I.
- 2) All questions in Section I were missing or marked n/a or Don't Know.

Surveys are excluded from analysis of questions occurring in Section II if:

- 1) The individual receiving supports was marked as the respondent to all questions in Section II but Section I was deemed invalid (for one of the reasons above).
- 2) No questions were answered in Section II.

The total number of valid In-person Surveys administered in 2017-18 was 25,671.

Responses for Section I

Only individuals receiving services may answer questions in Section I. As shown in Figure D, 65.8% of individuals in California's final 2017-18 sample were able to respond to Section I of the direct meeting; valid responses by regional center ranged from 50.3% to 80.2%.

Responses for Section II

Section II allows for multiple respondents who know the individual well (e.g., family, friend, support worker) to provide answers. If an individual's responses were excluded from

Section I in the final analysis, responses from Section II were also excluded if the individual was the only respondent to Section II. For 2017-18, the valid response rate (proxies included) to Section II was 99.8%.

Sampling

Each state is instructed to attempt to complete a minimum of 400 surveys with a random sample of individuals over the age of 18 who are receiving at least one publicly funded service besides case management. A sample size of 400 guarantees valid comparisons to be made across states with a 95% confidence level and a margin of error of +/- 5%, no matter how large the service population size. A 95% confidence level and a margin of error of +/- 5% is mandatory for each state's sample to be included in this report. Most states sample more than 400 individuals to account for refusals and surveys that may be deemed invalid.

In California, the overall approach was to draw a "core sample" based on the minimum numbers needed to yield valid samples from each regional center. This sampling strategy is consistent with the criteria employed in other NCI states. For each regional center, DDS drew a random sample of individuals age 18 or older who received at least one service besides case management. Based on the adult population sampling frame numbers provided by DDS, HSRI determined a target minimum number of 400 surveys per regional center would yield a representative sample that meets the standard of a +/-5% margin of error and a 95% confidence level.

A separate group of people who have transitioned from developmental centers to the community in the last five years (referred to as the "movers" subpopulation) was oversampled so their experience could be compared to a subgroup of "non-movers." The sample did not include anyone who was currently living in a developmental center.

In addition to the random oversample of movers, all individuals who have transitioned from Lanterman Developmental Center ("Lanterman movers") since July 2009 were contacted to participate in the survey. A total of 131 Lanterman movers were interviewed.

Analysis of the movers and Lanterman movers in this group as well as an analysis of individuals will be included in a supplemental report of findings compiled by the University of California, Davis.

Why do we ask states to collect 400 surveys?

When NCI asks states to pull a representative sample of 400 surveys, the aim is to compile a dataset that can provide a high level of statistical accuracy. This means that the goal is to create a dataset that can be used to make accurate inferences about the entire population of people using public services in each state. In order to do this, we ask each participating state to pull a sample that reaches the 95% confidence level/5% margin of error threshold; for most states, this sample size is 400.

A sample size that reaches the 95% confidence level/5% margin of error threshold means that if you sampled that number of people from the same population several times, 95% of your responses would fall within 5% above or below the actual percentages. So using this sample size we can assume relative accuracy. The larger the sample size, the smaller the margin of error and the greater the accuracy.

Statistical accuracy is largely a function of sample size. The larger the sample size, the greater the statistical accuracy of results (lower margin of error). However, gains in statistical accuracy are not proportional to increases in sample size. There are diminishing returns. For example, for a large total population, if the sample size increases by 100, and then by another 100, and then by another 100, the statistical accuracy might increase by 5%, then by 3%, then by 1%.

As a result, the 400 sample size gives a statistical accuracy of $\pm 5\%$ and is considered the most “cost effective” sample size for large-scale surveys. Meaning, you could sample more people, but the increase in statistical accuracy those “extra” people would provide is minimal, and not worth the money.

To play around with this, take a look at <http://www.raosoft.com/samplesize.html> NCI requires a margin of error at most 5% and a 95% confidence level. As you increase the population size (in our case, this represents the service population), you’ll see that the recommended sample size does not increase proportionally.

V.Data Analysis

Data Management and Analysis

HSRI coordinates the NCI data management and analysis. All states enter data into the Online Data Entry Survey Application (ODESA) system; California enters data into the CA-ODESA system. HSRI staff subsequently download the data into an SPSS data file. This data file is then “cleaned” (reviewed for completeness and compliance with standard NCI formats) and invalid responses are eliminated. Files from individual states are then merged into a single SPSS file. The merged file from 2017-18 was used for the analyses of California and NCI averages in this report.

Below is a summary of the statistical procedures used to analyze the In-person Survey data.

Weighting

Statistically, the term “average” refers to a calculated central or middle value of a set of numbers. In NCI reports, we use “NCI average” to demonstrate the typical performance of all the states that conducted the survey. Prior to the 2016-17 survey cycle, the NCI average was calculated as the simple arithmetic mean of all state means (an approach known as “average of averages”). Last year, the approach was enhanced to consider the relative numbers of people receiving services through participating states’ systems. The NCI averages contained in this report are “weighted” means; their calculations reflect the relative population sizes of participating states, as well as the sample sizes.

Applying statistical weights allows a state that provides services to a larger number of people (but is represented in the data by a sample of the same size as other states) to have a higher influence on the overall NCI average—that is, the state’s contribution to the NCI average is proportional to its service population. The weights used in calculations for this report were developed using each participating state’s number of survey respondents and its total survey-eligible population.

When a state’s sampling strategy is to identify and interview survey participants using simple random sampling or proportional stratified random sampling, each completed survey in the state gets assigned the same weight. In some cases, when a state’s sampling strategy departs markedly from simple random or proportional, it may be necessary for completed surveys in the state to be assigned different weights based on which sampling strata they correspond to. For example, if a state intentionally oversampled one or more of its sub-populations or geographical regions to be disproportionately represented in the

survey sample, it may be necessary to develop and apply different weights for surveys completed in those sub-populations or regions. The procedure for calculating weights is similar but uses the number of completed surveys and service population sizes in each stratum (i.e., sub-population or region) separately. **CA are weighted in this way in 2017-18.**

Collapsing Data

For many of the indicators in this report, only “yes” responses are analyzed and reported for state to state comparisons and significance testing. However, there are several indicators for which the “yes” response was collapsed with the middle response (for example, a “sometimes” response, or a “some input” response) to form the “yes” indicator category which was then analyzed and subsequently reported. For example, for choice indicators, responses “person chose” and “person had some input” were collapsed into one “yes, person chose” category. For those indicators, the two responses were considered to be equally indicative of a positive outcome. Appendix A contains the collapsing and recoding rules for all indicators and risk-adjustment variables.
